Splitly

Bill-splitting app

THE BOARD'S QUESTION

Is Splitly's viral coefficient really close to 1?

DATA PERIOD	DATA FILES	ROWS IN TOTAL	GROUPS
Jan 2025 → Jun 2026	**5 CSV files**	**313,740**	**5, 11, 17, 23**

The company

Business model. Free consumer app to split bills between friends; monetisation is planned later. Splitly is viral by design: you need your friends on the app to split with them. In **November 2025** Splitly launched a **double-sided referral bonus (€5 for the inviter + €5 for the invitee)**, paid when the invitee makes their first split. In **March 2026** a new onboarding step synchronises the phone's contacts and sends invitation SMS (enabled by default).

Situation. Downloads exploded. The team celebrates a "viral coefficient close to 1". The new CFO is less sure.

Data period

January 2025 → June 2026 (18 months). The data was extracted on **30 June 2026**: anything after that date is not observed yet, so an empty end date means *still active at extraction*.

All amounts are in euros. All companies and data are fictional.

Data files

`users.csv` 95,784 rows

Column	Description
`user_id`	unique user
`signup_date`	account creation
`source`	organic / paid / invite
`inviter_user_id`	for invite: who invited them
`country`	country
`activated`	1 = made at least one split
`splits_first_30d`	number of splits in the first 30 days
`last_active_date`	last day with activity (capped at 2026-06-30)

`invites.csv` 201,385 rows

Column	Description
`invite_id`	unique invite
`inviter_user_id`	sender
`sent_date`	date
`channel`	whatsapp / sms / link / auto_sms_contact_sync
`accepted`	1 = the invitee created an account
`invitee_user_id`	the new user (if accepted)

`referral_rewards.csv` 16,536 rows

Column	Description
`reward_id`	unique reward
`inviter_user_id`	inviter
`invitee_user_id`	invitee
`paid_date`	date
`total_cost_eur`	€5 + €5

`app_store_ratings.csv` 17 rows

Column	Description
`month`	month
`avg_store_rating`	average rating
`n_reviews`	number of reviews
`share_1_star`	share of 1-star reviews

`marketing_spend.csv` 18 rows

Column	Description
`month`	first day of month
`channel`	channel
`spend_eur`	spend

Data quality

> **THIS IS A RAW EXTRACT**
>
> The files come straight from production systems and **have not been cleaned**. Expect what real data contains: duplicates, internal or test accounts, inconsistent labels, mixed date formats, impossible values, missing values and gaps.
>
> Write down every cleaning rule you apply and how many rows it affects: **your cleaning log is graded.**

Guiding questions

The same five questions apply to every company. They are starting points, not a checklist: the best projects find what is not asked here.

1. Map the funnel and, if there is one, the growth loop. Where does value leak?
2. Which channels, segments, cities or periods behave differently? Does the difference survive once you compare like with like?
3. What are the unit economics: CAC, retention, LTV, payback, by cohort and by channel?
4. What changed during these 18 months, and what did each change cause?
5. Which North Star Metric would you give this company, and why?

What you hand in

A **growth model** with a backtest and 3 scenarios, a **4-page report** with an A/B test plan and your cleaning log, and **10 slides** for an 8-minute defense followed by a cold question. All details and the grading grid are in the project brief.
